Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This anti-idiotype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumour in an individual having low tumour burden. The antibody 11D10 is used to prevent the recurrence of HMFG associated tumours e.g. ovarian, non-small cell lung and pancreatic carcinoma,

                                                                                                                                                                                                                                                                   This cDNA sequence encodes the light chain variable region VL (AAM85149) of monoclonal anti-idiotype antibody 11D10 produced by hybridoma cell line Arcc 12020. 11D10 was obtained by immunising naive mice with MC-10 anti-HMFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol.wt. mucin of human milk fat globule (HMFG). It induces an immunological response to HMFG in mice, rabbits, monkeys and patients with advanced HMFG-associated tunnours. Pharmaceutical compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polynucleotides are claimed. Also claimed are aliagnostic kits and methods of using 11D10, 11D10 polypeptides and/or 11D10 polynucleotides, including methods of treating HMFG-
                                                                                                                                                    Monoclonal anti-idiotype antibody 11D10 - elicits immune response against human milk fat globule disease associated tumours, especially breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a method for delaying the development of, or treating a tumour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves administering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for RMFG (e.g. 3H1). The method is useful for
                                                                                                                                                                                                                                                                                                                      HMFG;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or

                                                                                                                                                                                                                                                                                      The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NGGD receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated polynucleotide are used for the preparation of a pharmaceutical composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, oesophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, meloma, leukeses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKGDr receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, cosphagus, colon, liver, intrahepatic bile ducts, pancreas, lung, ladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, bladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protocoa or helminiths. The autoimmune diseases include multiple sclerosis, Grave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent autoimmune hepatitis. The sequences represent DNA encoding the autoimmune hepatitis. The sequences represent DNA encoding the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated polynucleotide are used for the preparation of a pharmaceutical polynucleotide are used for the preparation of a pharmaceutical composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, oesophagus, colon, liver, intrahepatic bile ducts, pancras, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 163 TGGCTTCAGCAGGAACCAGATGGAACTATTAAACGCCTGATCTACGCCACATCCAGTTTA 222
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Multifunctional polypeptides comprising binding sites that specifically recognise extracellular groups of the NKG2D receptor complex and domains which function as receptors or ligands, useful for treating cancers and infectious diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sclerosis, Grave's disease, ankylosing spondylitis, acute anterior uvelfits, Goodpasture's syndrome, myasthenia gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatitis. NAME OF THE PROPERTY OF THE PR

```
antibody specific for a surface structure of antigen presenting antibody specific for a surface structure of antigen presenting cells (APC), genetically modified to contain at least one antigen exclusively at one or more preselected sites. The conjugate is capable of delivering the antigen to APC and eliciting an immune response to the antigen. The new conjugates are useful as vaccines and are able to elicit an enhanced immune response without the use of an adjuvant. In a specific example, a conjugate was constructed using the murine anti-human class II monocional antibody secreted by hybridoma anti-human persent sequence concodes the light chain variable region which was PCR amplified from 44H104 and used in the preparation of a conjugate with antigen CLTB36.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a recombinant conjugate antibody, comprising a monoclonal antibody specific for a surface structure of antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel recombinant conjugate antibody, useful as a vaccine against pathogens having a specific antigen, comprises a monoclonal antibody specific for an antigen presenting cell surface structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                presenting cells genetically modified to contain an antigen molety for the purpose of delivery of the antigen moiety to antigen-presenting cells of the immune system. The conjugate antibody is formulated as a vaccine to protect a host against a disease caused by a pathogen expressing the antigen. The antibody is useful as a detecting agent. The present sequence is murine 44H104 mab variable
                                                                                                                                                                                                                                                                        Murine; mab; light chain; VL; conjugate antibody; antigen delivery; immune system; vaccine; detecting agent; antibacterial; gene; ds.

```
The invention relates to methods for producing catalytic antibodies displayed on a phage. The method comprises: (a) generating a gene library of antibody-derived domains; (b) inserting coding for the domains into a phage expression vector; and (c) isolating the catalytic antibodies. The phage expression vector incorporates a histidine peptide in tandem with a mary peptide. The catalytic antibodies can be isolated by preparing an antigen; optionally immunising an animal with the antigen; generating a library of VH and VL domains from the immunised animal; cloning the VH and VL domains into a phage expression vector to generate phage display antibodies; selecting phage display antibodies which bind specifically to the antigen; screening the selected phage display antibodies for
                                                                                                                                                                                                        Mouse derived RT3 phage antibody light chain pattern C genetic sequence.
                                                                                                                                                                                                                                          antibody; phage display; immunising; phage expression vector;
                                                                                                                                                                                                                                                                                                                                       1..276

catalytic activity to substrate, and isolating the catalytic antibodies, where the phage expression vector incorporates a histidine peptide in tandem with a myc peptide. The processes are used to produce catalytic antibodies, which can be used for in vivo activation of a prodrug. The present sequence represents a genetic sequence of light chain PCR pattern C from mouse derived RT3 phage antibodies.

displayed on a phage. The method comprises: (a) generating a gene library of antibody-derived domains; (b) inserting coding for the domains into a phage expression vector; and (c) isolating the catalytic antibodies. The phage expression vector incorporates a histidine peptide in tandem with a myc peptide. The catalytic antibodies can be isolated by preparing an antigen; optionally immunising an animal with the antigen; generating a library of VH and VL domains from the immunised animal; cloning the VH and VL domains from the immunised animal; cloning the VH and VL domains from the selected phage display antibodies for catalytic antigodies for catalytic activity to substrate; and isolating the catalytic antibodies.

Where the phage expression vector incorporates a histidine peptide in catalytic antibodies, which can be used for in vivo activation of a produce catalytic antibodies, which can be used for in vivo activation of a produce. The present sequence represents a generic sequence of light chain pattern A from mouse derived RT3 phage antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    222

Muscosal adressin cell adhesion molecule-1 (MadCAM-1) is a ligand of this particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadCAM-1, which is present of high endothelial venules in mucosal lymph nodes. Variable regions were amplified from DNA encoding to primers Av2003-84. The degeneracy of the PCR primers Av2003-84. The degeneracy of the PCR primers produced several different sequence, of which the present sequence is a consensus sequence. The present sequence was used to construct chimeritc, humanised Act-1 antibodies, which contain mutine antigen binding regions. The humanised immunoglobulin can be used to inhibit the interaction of cells bearing alpha4-beta7 with cells bearing a ligand for alpha4-beta7. It can be used for inhibiting leukocyte infilitation of tissues, e.g. for treating inflammatory diseases such as inflammatory bowel disease. The immunoglobulin can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprising the variable region of murine Act-1 antibody determined from several independent mouse light chain variable region clones. Act-1 is

The invention relates to a method of inhibiting Pseudomonas aeruginosa infection by inoculating a patient with PcrV antigen. Or inoculating a patient with a gene vaccine encoding the PcrV antigen. The method is useful for inhibiting P.aeruginosa infection in a patient, preferably a human patient, for treating P.aeruginosa infection, where the infected patient is incculated with PcrV antigen, and for diagnosing P.aeruginosa infection. An antibody to the antigen, or its fragments, (preferably monoclonal antibodies) is useful for modulating cytotoxicity of Pseudomonas to a human cell which involves contacting the Pseudomonas with the antibody in the presence of the human cell. A pharmaceutical composition comprising the monoclonal antibodies can be used for treating or preventing Pseudomonas infection, or for reducing pathogenicity of Pseudomonas in a patient. This sequence represents cDNA encoding a murine mi66 antibody light chain polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               341 CTCCGTACACGTTCGGAGGGGGACCAAGCTGGAAATAAAACGGGCTGATGCTGCACCAA 400

The present sequence encodes the mouse monoclonal antibody B9 light chain (B9L), which binds specifically to human blood apolipoprotein B-100. The nucleic acid can be used in a method for the preparation of a reconstituted antibody which specifically binds human plasma apolipoprotein B-100. The antibody can be used as a reagent for determining the concentration of human plasma apolipoprotein B-100 in a sample. The antibody is also useful in a drug composition for selectively removing arteriosclerotic lipoproteins containing human plasma apolipoprotein B-100.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
